

LIGHT AND SHADOW

Just as light gives objects their shape and color, so it gives them their position. When a light source is on the left, the shadow of an object is cast to the right. When the light source is on the right, the shadow is cast to the left. The shadow of an object is always cast in the opposite direction from the light source. The shadow of an object is always cast in the opposite direction from the light source. The shadow of an object is always cast in the opposite direction from the light source.

Shadow is cast in the opposite direction from the light source.

The principle remains the same. Whenever a light source is on the left, the shadow of an object is cast to the right. When the light source is on the right, the shadow is cast to the left.

When a light source is on the left, the shadow of an object is cast to the right. When the light source is on the right, the shadow is cast to the left. The shadow of an object is always cast in the opposite direction from the light source.
